

What are the e-infrastructure needs for your research?

- Groups of 2-3 people, break rooms
- Briefly discuss the research project of each group member, then choose one
- One of the team members takes notes and shares her/his screen with the others.
- For the chosen project, discuss briefly how the following aspects are currently organized:
 - Data (where and how acquired, storage, transport, size, formats, management ...)
 - Methods (programs, processing time, required memory, storage of results, ...)
 - Collaboration (who is involved, how they communicate and exchange data and methods, access control)
 - Physical distribution (location of people, data and methods; how are they connected to each other)
- Discuss challenges faced today regarding the current infrastructure
 - what works well and what is missing or could be improved?
- Where appropriate, build a mind map
